

## How to export your work as an HTML file

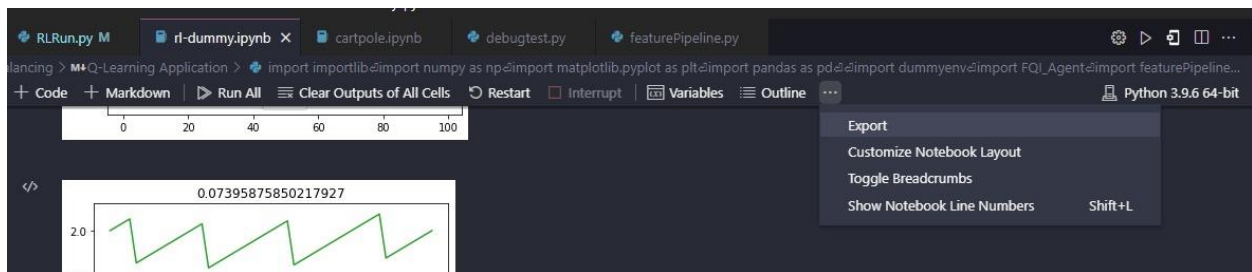

### - Using Jupyter Notebook:

Run your .ipynb code, then click on File > Download as > HTML (.html), as shown in the picture below.

### - Using VS Code:

Run your .ipynb code (do not write .py, so that the outputs are visible in html format.), then click on ... > Export, and select HTML.

### - Using PyCharm:

Please check: <https://www.jetbrains.com/help/pycharm/export-to-html.html>; alternatively, run your code in PyCharm and open it in Jupyter, then save as .html.

### - Using Colab:

If you want to work in [Colab](#), unfortunately there is no option to download your work as .html output. But you can run it first and then download it as .ipynb, then save it using Jupyter Notebook. The advantage here is that, you don't have to install PuLP on your computer. When you run it on Colab before saving it, the outputs will be visible in Jupyter Notebook as well.
